Curriculum Intent

The ICT and Computing curriculum have been designed to allow you to learn about a number of different aspects of technology.

You will be provided with the opportunity to use a variety of software applications. You can take these skills with you in whichever path you choose in life. These skills include everything from word processing and presentations to interactive multimedia.

You will also be able to understand how the technology you use works. Different elements of the theory behind the technology will be investigated. This will help you to understand the input, process and output cycle which, can be applied to most topic areas across the whole school curriculum.

Core standards

The key fundamentals to complete include analysis, design, planning, implementation, testing and reviewing project-based scenarios. This is to provide each pupil with ownership of their project from start to finish as if they were in a working environment. These skills can then be carried into their place of work.
